Computerized Cognitive Training in Breast Cancer Survivors

Many breast cancer survivors report problems with their ability to attend to, remember, process information and/or problem-solve. Many breast cancer survivors report problems with these cognitive abilities, which may also affect other self-reported symptoms, their ability to work, and overall quality of life.

This study tests ways for you to improve your cognitive function without taking any medication.

Who Can Participate?

Female breast cancer survivors of non-metastatic breast cancer reporting some cognitive impairment. Must be at least 21 years of age, post-chemotherapy treatment at least 1 year, with no history of other cancers (basal cell cancer okay), able to understand, speak, read, and write English.

What Does This Study Include?

Women will be placed into 1 of 2 groups to learn ways to improve their cognitive function. Each group will complete 40 hours of training over 10-week period.

Women will be asked to complete 2 visits before and after the training. The 2 visits will be done on the IUPUI campus at the School of Nursing (Indianapolis). At the visits, we will: give you some questionnaires to fill out, complete a cognitive evaluation (e.g. remember and repeat a story), and draw blood.

Participants will receive a gift card for \$20.00 after completing each visit at our center on the IUPUI campus.
